

EXECUTIVE SUMMARY

Infoblox looked for exposure tied to your brand and your domain across breach data, dark web sources and the public web. Below is what was visible on 02 September 2026, and what each number means.

papajohns

Brand name

papajohns.com

Domain

02 Sep 2026

Scan date

● Red is what somebody could use today. ● Amber is exposure that needs a further step first.

EXPOSED CREDENTIALS

Work accounts on this domain whose passwords have already been exposed somewhere outside your company.

They come from three places: company breaches, dumps traded on criminal forums, and staff or customer computers infected with password-stealing malware.

2,346

Total

Every exposed account we can see.

2,056

In readable form

The password itself is readable, so anyone holding it can try to log in today.

IMPERSONATION SITES

Web pages built to look like you, so a customer or an employee hands over a login or a card number.

Only pages Axur is highly confident are impersonating this brand are counted. Pages that only mention the name are left out.

0

Sites

Pages seen impersonating the brand.

LOOKALIKE DOMAINS

Domain names one character away from yours, such as a swapped or doubled letter. They exist to be mistaken for you.

A lookalike is only a nuisance until someone sets up email on it. At that point it can send a message that appears to come from your company.

0

Registered

Lookalike names somebody has bought.

58

Mail-enabled

Of those, the ones with email already switched on. These can send a convincing fake today.

EXTERNAL ATTACK SURFACE

The servers, services and open doors reachable from the public internet under your name.

Not counted here. It comes from a different screen: one.axur.com/easm, Exposures, then Download all.

EVIDENCE Step through the records behind every number, in order

Counts taken from one.axur.com. They move daily. Passwords are never included in this report.

The records behind the numbers

Each page below shows a sample of the records counted on the summary, with the exact search that found them. The count is the whole set; the table is a sample.

Exposed credentials

One row per exposed account. The source column names where it turned up. An account can appear more than once if it leaked more than once.

emailDomain="papajohns.com"
